

The Solution Elasticated Crossover Breastgirth

The Solution breastgirth is the only design that is fitted with straps that move and stretch independently, so eliminating pressure points and allowing complete freedom of movement.

Fitting The Solution crossover breastgirth

It is important that the design of any breastgirth does not hamper the movement of the scapula, but in order to be of any benefit, it must be fitted so that there is some tension on the saddle and the girth. - For this reason, it is essential that the straps are fully elasticated.

Easy to use:

Simply clip the lower strap to the top D rings and the top strap to the knee D rings or remove the clips and attach through the girth billets.

Security and stability:

The girth strap helps the girth to stay in place and ensures it does not slide back.

Perfect fit:

The breastgirth should fit snugly when the horse is standing, as it will be looser when the neck is raised in movement. The tension should be equal on all straps and the leather straps can be adjusted as needed.

1. Clip the breast girth bottom strap to the top D rings on the saddle.

2. Clip the breast girth top strap to the knee D rings or remove the clips and loop through the girth billets.

3. Pass the girth through the girth strap and girth up.

4. Check the tension is equal on all straps and adjust the buckles if necessary.
